Symbols used in the text

These paragraphs contain tips and practical advice for working with the 2D system

In the paragraphs highlighted with this symbol, you will find additional information and it is very important that you follow the instructions given.

Documentation reference

A user manual reference number is provided so the user can seek further assistance

1 Introduction

The GPS-Laptrigger is used to generate lap trigger signals via GPS. You can use the predefined start lines of more than 300 race tracks or create your own start line position.

2 Connecting the Laptrigger

The following table shows the connector layout of the GPS-Laptrigger. Pin4 has a combined input/output function. The input function is used for manually defining lap positions. The output function is used for sending the lap-trigger signal.

<u> </u>	Pin	Name	Description	Wire color
1• •5	1		Do not use!	
2• •4	2		Do not use!	
	3	GND	Ground	black
3	4	Button/LAP	Push-button in/LAP out	yellow
Binder 712M, 5 pin	5	Vext	Power in (8 V – 18 V)	red

3 Defining a GPS-Laptrigger-Position

There are two ways of input of the GPS coordinates for defining a lap trigger position:

- a) Automatic: the GPS-Laptrigger searches for matching start line coordinates in its table of predefines race tracks.
- b) Manual: you can define your own start lines by pushing the button.

As soon as the GPS Laptrigger has found the satellite's signal, it checks if the last used trigger coordinates are valid for the actual position (within a radius of 5 km). If the position is valid, it will be used to create a lap trigger. Otherwise the module searches if there is a matching start line stored in its GPS coordinates table. Have a look at the appendix (section 5) for the race track start lines which are stored in this table.

If there is no matching start line stored or you want to use another position you can manually define a position. To define a position you push the button (refer to section 2) while driving/riding (speed > 5 km/h) – for longer than 0.5 s. The module will then use the actual position of the vehicle (at the start of pushing) as a trigger position.

Manually defined lap trigger positions will not be stored in the table!

You receive the trigger signal for further use on "LAP". Refer to section 2.

To delete the actual used lap trigger position you push the button while the vehicle does not move (speed < 5 km/h). Then the GPS Laptrigger will search again for matching start lines in its table of predefined race tracks.

4 Blink codes

There are three different blink codes implemented:

- 1) If there is no valid GPS signal the blink frequency is 1 Hz
- 2) If the GPS signal is valid the blink frequency is 5 Hz
- 3) If the GPS signal and the trigger coordinates are valid the blink frequency is 12 Hz
